

Renomedly Launch-Readiness Operational Audit Report

Role: Chief Product Operations Architect & Launch Execution Commander

Focus: Speed, Stability, Founder Efficiency, Startup Survivability

1. Executive Summary: The Launch-Critical Path

The core value proposition of Renomedly is **Prescription Literacy + Family Medication Sanctuary**. To launch dominant, the system must prioritize trust and reliability over feature breadth.

The "Build Now" vs. "Build Later" Matrix

Category	Build Now (Launch Critical)	Build Later (Scale/Optimization)
Auth	Clerk Integration + Sanctuary Redirect Logic	Multi-factor Auth / Social Logins (beyond basic)
Sanctuary	Invite Code + Primary Caregiver Role	Multi-Sanctuary Switching
Payments	Razorpay Webhook + Sanctuary-wide Premium	Tiered Subscription Plans / Coupons
OCR	High-Confidence Vision API Pipeline	Handwriting-Specific Fine-tuning
Notifications	Basic Medication Reminders (Firebase)	Escalation Logic (Call-to-confirm)

2. Phase-by-Phase Operational Audit

Phase 1: Auth & Sanctuary Foundation

- Complexity Score:** 4/10
- Must-Have:** Post-auth decision engine (Does user have a Sanctuary? If no, Create/Join).

- **Hidden Blocker:** Clerk user metadata sync. If the `sanctuary_id` isn't synced to Clerk, every page load will require a DB lookup, slowing down the app.
- **Simplification Move:** Use the existing invite code UI as the *only* way to join. No manual email invites for V1.

Phase 2: Simplified Role System

- **Complexity Score:** 3/10
- **Must-Have:** Admin (Owner) and Member (Caregiver/Patient).
- **Defer:** Viewer role. It adds 30% more testing complexity for <5% of initial user needs.
- **Operational Risk:** Ensure the "Patient" role can still mark meds as taken without needing Admin approval, or trust breaks.

Phase 3: Razorpay & Payment Ops

- **Complexity Score:** 7/10
- **Must-Have:** Robust signature verification and "Sanctuary-wide" premium status.
- **Hidden Blocker:** Razorpay webhooks failing. If the webhook fails, the user pays but the app stays "Free."
- **Simplification Move:** Implement a "Check Payment Status" button in the UI that triggers a manual server-side check against Razorpay API as a fallback.

Phase 4: Notification Foundation

- **Complexity Score:** 6/10
- **Must-Have:** Firebase Cloud Messaging (FCM) token registration on login.
- **Risk:** Token expiration. If a user logs out and back in, the old token must be cleared to prevent "ghost notifications."

3. Technical Operational Risks & Mitigation

Risk Factor	Impact	Mitigation Strategy
Clerk Dependency	High	Cache session data locally; don't rely on Clerk for business logic.
Sanctuary Schema	High	Use a <code>memberships</code> join table rather than putting

		sanctuary_id on the User table to allow future multi-family support.
Razorpay Failure	Medium	Implement "Mock Mode" for internal testing; use robust logging for all payment attempts.
OCR Inaccuracy	Critical	Always show "Confidence Score" and require user confirmation for dosage/timing.

4. Founder Execution Matrix (Launch Command)

Today: Stability First

1. **Validate Auth:** Ensure new signups don't get stuck in a "No Sanctuary" loop.
2. **Test Join Flow:** Use a real invite code on a second device.

This Week: The Trust Wedge

1. **OCR Stress Test:** Test with 20 different Indian prescription formats.
2. **Notification Audit:** Ensure reminders fire within +/- 60 seconds of scheduled time.

Closed Beta: Founder Control

1. **God Mode:** Build a simple admin page to manually upgrade a Sanctuary to "Premium" if Razorpay fails during a live demo.

5. Final Launch Checklist (The "No-Fail" List)

- ☐ **Auth:** User can login, logout, and reset password.
- ☐ **Sanctuary:** Invite code generates, joins correctly, and prevents duplicate joins.
- ☐ **Payments:** Successful payment unlocks all features for *all* members of that Sanctuary.
- ☐ **OCR:** Vision API extracts Name, Dosage, and Frequency with >90% accuracy on clear photos.
- ☐ **Safety:** Primary Caregiver can remove a member or delete the Sanctuary.

- **UI:** All "Family" references renamed to "Sanctuary" for emotional branding.
-

6. Founder Risk Dashboard (The "Red Flags")

- **Churn Trigger:** If notifications are missed 2 days in a row, the user will delete the app.
- **Growth Blocker:** If the "Join Sanctuary" flow takes more than 3 clicks, caregivers won't invite family.
- **Technical Debt:** Over-reliance on hardcoded "Beta Gates" will make the public launch a nightmare. Move beta-gate logic to a DB flag.

End of Audit.

Action: Proceed to Phase 1 (Auth + Sanctuary) implementation immediately.
